

# Decidability issues for infinite integer sequences with finite support

A. Sirokofskich  
University of Crete

July 17, 2013

## Few words on notation

- $\mathbb{Z}^{<\omega}$  is the set of all infinite sequences over  $\mathbb{Z}$ , with finite support.

## Few words on notation

- $\mathbb{Z}^{<\omega}$  is the set of all infinite sequences over  $\mathbb{Z}$ , with finite support.
- $(x)_i$  stands for the  $i$  co-ordinate of  $x \in \mathbb{Z}^{<\omega}$ .

# Multiplicative group $(\mathbb{Q}^+, \times)$

Consider the set of positive rationals,  $\mathbb{Q}^+$ .

# Multiplicative group $(\mathbb{Q}^+, \times)$

Consider the set of positive rationals,  $\mathbb{Q}^+$ .

Additive group  $(\mathbb{Z}^{<\omega}, +)$  is isomorphic to the multiplicative group  $(\mathbb{Q}^+, \times)$ .

# Multiplicative group $(\mathbb{Q}^+, \times)$

Consider the set of positive rationals,  $\mathbb{Q}^+$ .

Additive group  $(\mathbb{Z}^{<\omega}, +)$  is isomorphic to the multiplicative group  $(\mathbb{Q}^+, \times)$ .

Let the sequence  $(p_i)_{i \in \mathbb{N}}$  be the natural enumeration of the set of primes.

# Multiplicative group $(\mathbb{Q}^+, \times)$

Consider the set of positive rationals,  $\mathbb{Q}^+$ .

Additive group  $(\mathbb{Z}^{<\omega}, +)$  is isomorphic to the multiplicative group  $(\mathbb{Q}^+, \times)$ .

Let the sequence  $(p_i)_{i \in \mathbb{N}}$  be the natural enumeration of the set of primes. Then the element  $n = \prod p_i^{m_i}$  of  $\mathbb{Q}^+$  corresponds to the element  $x \in \mathbb{Z}^{<\omega}$  with  $(x)_i = m_i$  for  $i \in \mathbb{N}$ .

# 'Notion of gcd'

We can define a notion of divisibility  $|$  in  $\mathbb{Q}^+$  as follows:

# 'Notion of gcd'

We can define a notion of divisibility  $|$  in  $\mathbb{Q}^+$  as follows:

let  $n_1 = \prod p_i^{m_i}$  and  $n_2 = \prod p_i^{k_i}$ , then

$$n_1 | n_2 \iff \forall i (m_i \leq k_i).$$

# 'Notion of gcd'

We can define a notion of divisibility  $|$  in  $\mathbb{Q}^+$  as follows:

let  $n_1 = \prod p_i^{m_i}$  and  $n_2 = \prod p_i^{k_i}$ , then

$$n_1 | n_2 \iff \forall i (m_i \leq k_i).$$

We extend the usual notation of gcd for  $n_1, n_2$  in  $\mathbb{Q}^+$ , i.e.,

# 'Notion of gcd'

We can define a notion of divisibility  $|$  in  $\mathbb{Q}^+$  as follows:

let  $n_1 = \prod p_i^{m_i}$  and  $n_2 = \prod p_i^{k_i}$ , then

$$n_1 | n_2 \iff \forall i (m_i \leq k_i).$$

We extend the usual notation of gcd for  $n_1, n_2$  in  $\mathbb{Q}^+$ , i.e.,

$$\gcd(n_1, n_2) = \prod p_i^{\min\{m_i, k_i\}}.$$

It is well known that gcd is definable from  $|$  in the substructure  $(\mathbb{Z}^+, |, =)$  of  $(\mathbb{Q}^+, |, =)$ .

It is well known that  $\text{gcd}$  is definable from  $|$  in the substructure  $(\mathbb{Z}^+, |, =)$  of  $(\mathbb{Q}^+, |, =)$ .

For  $x, y \in \mathbb{Z}$  we have that

$$d = \text{gcd}(x, y) \text{ if and only if } (d|x) \wedge (d|y) \wedge \forall w[w|x \wedge w|y \rightarrow w|d]. \quad (1)$$

It is well known that  $\text{gcd}$  is definable from  $|$  in the substructure  $(\mathbb{Z}^+, |, =)$  of  $(\mathbb{Q}^+, |, =)$ .

For  $x, y \in \mathbb{Z}$  we have that

$$d = \text{gcd}(x, y) \text{ if and only if } (d|x) \wedge (d|y) \wedge \forall w[w|x \wedge w|y \rightarrow w|d]. \quad (1)$$

Note that  $|$  is existentially definable in  $(\mathbb{Z}^+, \times, =)$  by

$$x|y \text{ if and only if } \exists z[x \times z = y]. \quad (2)$$

It is well known that  $\text{gcd}$  is definable from  $|$  in the substructure  $(\mathbb{Z}^+, |, =)$  of  $(\mathbb{Q}^+, |, =)$ .

For  $x, y \in \mathbb{Z}$  we have that

$$d = \text{gcd}(x, y) \text{ if and only if } (d|x) \wedge (d|y) \wedge \forall w[w|x \wedge w|y \rightarrow w|d]. \quad (1)$$

Note that  $|$  is existentially definable in  $(\mathbb{Z}^+, \times, =)$  by

$$x|y \text{ if and only if } \exists z[x \times z = y]. \quad (2)$$

The relation (2) does not extend to the multiplicative rationals.

Moreover, the 'gcd' is not definable in  $(\mathbb{Q}^+, \times, =)$ .

Moreover, the 'gcd' is not definable in  $(\mathbb{Q}^+, \times, =)$ .

Any module over a fixed ring has stable theory in the language of modules.

Moreover, the 'gcd' is not definable in  $(\mathbb{Q}^+, \times, =)$ .

Any module over a fixed ring has stable theory in the language of modules.

On the other hand, the notion of 'gcd' implies some kind of ordering, namely the formula

$$\varphi(x, y) : \text{'gcd'}(x, y) = x$$

is unstable.

# Language and structure

$$L = \{+; \min; C; \{|_n\}_n; \{\delta_c\}_c\}$$

$$\mathcal{A} = (\mathbb{Z}^{<\omega}; +; \min; C; \{|_n\}_{n \in \mathbb{N}}; \{\delta_c\}_{c \in \mathbb{Z}^{<\omega}}),$$

# Language and structure
